Speaker 1:

I need to buy milk, bread, eggs, and chips, but I don't want to spend more than ₹500. So before selecting anything, I'm going to pay attention to the prices.

I'll search for milk first. There are different options, so I want to compare the prices and quantities. I don't necessarily want the cheapest product if the quantity is much smaller.

Now I'll search for bread. I'll check the price and choose one that fits my budget. Next, I'll search for eggs. I want to make sure I know how many eggs are included in the pack before adding it.

Finally, I'll look for chips. I'll select a packet and add it to my cart.

Now I'm opening the cart to calculate how much I've spent. I want to see the price of every product separately, along with the total. If there are delivery fees or handling charges, I want those to be visible too.

If my total is more than ₹500, I'll need to remove something or choose a cheaper option. I don't want to discover that my budget has been exceeded only at the last step.

Now I'm repeating the task on the modified prototype. I'm checking whether it's easier to compare prices and understand the total cost.

I would find it useful if the app showed how much of my budget I've used and how much money I have left. That would make it easier to make decisions while shopping.

For me, convenience doesn't just mean ordering quickly. It also means knowing exactly how much I'm paying. I would prefer a design that makes prices transparent and helps me stay within my budget without constantly doing calculations myself.

Speaker 2 :

I need milk, bread, eggs, and chips, and I have ₹500. I want to finish this as quickly as possible, so I'm going straight to the search bar.

I'll type milk, select an option, and add it to the cart. Now I need bread. I'm hoping I can search for the next item immediately because going back and forth between screens takes time.

Okay, bread is added. Now eggs. I'll search for them and select a pack. Finally, chips. I'll choose a packet and add that too.

Now I need to check the cart. I want to confirm that everything is there and that I haven't accidentally added the same product twice. I also need to check the final amount.

I don't really want to spend time looking at banners or recommendations when I already know what I'm buying. I prefer an interface that lets me focus on my task.

Now I'm doing exactly the same thing on the modified prototype. I'm paying attention to how many steps I need to complete the purchase and whether searching for products feels faster.

I like designs where the search bar is easy to access and the cart is always easy to find. If I can quickly switch between products without unnecessary navigation, that would save me time.

I also want the app to respond immediately when I add something to the cart. I don't want to tap a button multiple times because I'm unsure whether it worked.

For me, speed matters more than having lots of extra features. If the modified design helps me complete the task with fewer steps and less effort, I would prefer it. The whole point of quick commerce is convenience, so the shopping process itself should feel quick too.

Speaker 3:

I'm going to buy milk, bread, eggs, and chips within ₹500. I'm opening the app now, and first I want to understand how everything is organized.

I can see different options on the home screen. I'm looking for the search bar because that seems like the easiest way to find a particular product. I'll type milk.

Okay, I can see some results. I need to understand which product to choose, so I'm looking at the names, prices, and quantities. I think the information is important because I don't want to accidentally select the wrong size.

Now I'll search for bread. I have to figure out how to get back to the search option. I hope I can do this without losing the product I've already selected.

Next, I'll search for eggs and then chips. I would like the app to clearly show when something has been added to my cart. Otherwise, I might not be sure whether my selection worked.

Now I'll open the cart and check whether all four products are there. I also want to see the total price and any extra charges before proceeding.

Now I'm trying the same task on the modified prototype. I'm checking whether the layout makes more sense and whether I can understand what to do without spending too much time figuring it out.

I personally prefer clear labels, readable prices, and buttons that are easy to recognize. If the design is too crowded, I might get confused.

For me, the best shopping app is one that guides me naturally from searching for products to checking my cart. I don't want to guess what to do next. If the prototype makes those steps clearer, I would find it easier to use.

Speaker 3 :

Okay, I need to buy milk, bread, eggs, and chips, and my budget is ₹500. I'll start by looking at the home screen. I can see the search bar, so I'll use that instead of going through all the categories.

I'll search for milk first. There are different brands available, so I'll quickly compare their prices and select one. I expect this to be easy because I already use grocery delivery apps.

Now I'll search for bread. I hope I don't have to go back to the home screen every time I want to find a different product. Okay, I've selected the bread. Next, I'll search for eggs and add them to my cart.

Finally, I need chips. I'll search for them and select a packet. Now I want to check my cart to make sure all four products are there.

I can see the products, but I also want to know the final amount. Sometimes additional charges appear during checkout, so I want to make sure I stay within ₹500. I would prefer seeing the complete cost clearly before placing the order.

Now I'm trying the same task on the modified prototype. The main thing I'm looking for is whether I can find products and move between searches more easily.

I like it when the important buttons are easy to find and I don't have to think too much about where to tap. If I can add products quickly and check the total without opening too many screens, that would make shopping more convenient.

Overall, I want the experience to be quick and simple. Since I'm already familiar with Zepto, I don't need too many instructions. I just want to find what I need, pay a reasonable price, and finish my order quickly.

Speaker 4 :

Okay, I need to buy milk, bread, eggs, and chips, and my budget is ₹500. I'll start by looking at the home screen. I can see the search bar, so I'll use that instead of going through all the categories.

I'll search for milk first. There are different brands available, so I'll quickly compare their prices and select one. I expect this to be easy because I already use grocery delivery apps.

Now I'll search for bread. I hope I don't have to go back to the home screen every time I want to find a different product. Okay, I've selected the bread. Next, I'll search for eggs and add them to my cart.

Finally, I need chips. I'll search for them and select a packet. Now I want to check my cart to make sure all four products are there.

I can see the products, but I also want to know the final amount. Sometimes additional charges appear during checkout, so I want to make sure I stay within ₹500. I would prefer seeing the complete cost clearly before placing the order.

Now I'm trying the same task on the modified prototype. The main thing I'm looking for is whether I can find products and move between searches more easily.

I like it when the important buttons are easy to find and I don't have to think too much about where to tap. If I can add products quickly and check the total without opening too many screens, that would make shopping more convenient.

Overall, I want the experience to be quick and simple. Since I'm already familiar with Zepto, I don't need too many instructions. I just want to find what I need, pay a reasonable price, and finish my order quickly.

Speaker 5 :

I'm going to purchase milk, bread, eggs, and chips within ₹500. First, I'm looking at the home screen to understand how the products and categories are arranged.

I can see the search option, so I'll start with milk. I want the product names, images, and prices to be easy to understand. If the screen is too crowded, it becomes harder for me to find what I need.

I'll select milk and move on to bread. I'm looking at how the app takes me from one step to another. I prefer it when the layout stays consistent and the important buttons remain easy to locate.

Now I'll search for eggs and add a pack. Finally, I'll search for chips and add those too. I expect some kind of confirmation so I know the products have been added successfully.

Now I'm opening my cart. I want to see all four items arranged clearly. I should be able to identify the product names, change quantities, or remove an item without confusion.

I'm also checking the final amount because I need to stay within ₹500. The total should be noticeable rather than hidden somewhere at the bottom of the screen.

Now I'm trying the modified prototype. I'm comparing the overall layout and seeing whether the shopping process feels more organized.

I like an interface that looks clean and modern, but appearance alone isn't enough. The buttons need to work as expected, the text should be readable, and the next step should be obvious.

If the prototype helps me find products more easily and review my cart without confusion, I would consider that a good improvement.

For me, good design means making the user's task easier. I shouldn't have to spend time understanding the interface when I could be spending that time completing my shopping.
